The **Medical Transportation** toolkit was adapted from NADTC’s fall 2019 [online course](#) which provided an in-depth look at transportation programs addressing the gaps in access to health care services in their community and how these programs play a key role in providing medical transportation services to older adults and people with disabilities.

Medical transportation is an important option for providing access to health care services for older adults and people with disabilities. According to the [Eldercare Locator](#) which connects older adults and caregivers to local support and resources, the top need for consumers is transportation assistance.

NADTC recognizes the importance of providing organizations and communities with the tools to understand how to manage and operate a medical transportation program whether starting or currently operating a program to better serve older adults, people with disabilities, veterans and low-income populations.

This toolkit is divided into 2 sections. Section 1 is a collection of written and video materials from the course which can be viewed independently. Section 2 includes links to resources and supplemental reading that tie in to the material presented in the course.

### KEY FACTS

- 3.6 million Americans miss medical appointments or delay care because they do not have access to proper transportation.
- 74% of calls to Eldercare Locator are individuals needing transportation to medical appointments.
- 13-14% of cancer patients experience transportation problems related to obtaining care.
- 48% of older adults report “it can be challenging” to find rides to doctor’s appointments.
